1. BRAINSTORMING & IDEATION PHASE

Title	Auto Ticket Classification using Flow Designer
Team ID	SWTID-2026-2673
Team Lead	VENKATESH M
Team Member	VIGNESH R

The project idea came from the problem faced by the school IT helpdesk in handling multiple incident requests from students and teachers. Common issues include Wi-Fi problems, projector failures, password or login problems, and slow computer performance. IT staff manually review each request, identify the issue, select the appropriate category and subcategory, and inform the caller, making the process time-consuming and inefficient. The idea of automating ticket classification using ServiceNow Flow Designer was selected to address this problem. The proposed system analyzes keywords in the ticket description and automatically identifies the appropriate category and subcategory. The main aim is to reduce manual effort, improve ticket routing efficiency, and provide a simple no-code solution that can be easily maintained.
