2. REQUIREMENT ANALYSIS PHASE

Title	Auto Ticket Classification using Flow Designer
Team ID	SWTID-2026-2673
Team Lead	VENKATESH M
Team Member	VIGNESH R

The ticket classification system requires automatic classification of IT tickets based on the issue description. Category and Subcategory should be assigned without manual intervention. A dependency between Category and Subcategory is required so that the appropriate subcategory is associated with the selected category. The system also requires an automated email notification to the caller after ticket creation. Ticket information is stored in a structured and standardized format. Easy maintenance and future scalability are also considered as important requirements for the system.
