| Team Member | VIGNESH R |

A Local Update Set named **Project Update Set** is created in ServiceNow. The Update Set is configured with the state **In Progress** and the application set to **Global**. It is made the current Update Set so that the configuration changes made during the project can be captured. The project activities include creating the custom table, configuring the required fields and choices, establishing the Category and Subcategory dependency, creating the Flow Designer automation, configuring email notification, testing the automation, and preparing the completed Update Set for deployment. This provides an organized structure for managing the project configuration.
