6. PROJECT TESTING PHASE

Title	Auto Ticket Classification using Flow Designer
Team ID	SWTID-2026-2673
Team Lead	VENKATESH M
Team Member	VIGNESH R

TheThe ticket classification system is checked for correct mandatory field capture, unique auto-number generation, accurate Category and Subcategory values, and proper reference field connections. In the first test scenario, a caller is entered and the Short Description **“WiFi not working in library”** is provided. After saving and reloading the record, the system automatically assigns **Network** as the Category and **Wi-Fi** as the Subcategory. An email is also sent to the caller's email address. The email notification is checked through the Emails section in ServiceNow by searching for the given subject and previewing the generated mail. A second test uses the Short Description **“Projector not turning on.”** The system automatically assigns **Hardware** as the Category and **Projector** as the Subcategory, and an email is sent to the caller.
