PROJECT DOCUMENTATION

Title	Auto Ticket Classification using Flow Designer
Team ID	SWTID-2026-2673
Team Lead	VENKATESH M
Team Member	VIGNESH R

The project documentation includes the custom table, fields, field types, Category and Subcategory choices, dependent field configuration, Flow Designer conditions, automatic classification rules, email notification, and testing results. The **Project Update Set** created during development is also prepared for final use. After the development and testing activities, the Update Set state is changed from **In Progress** to **Complete**. The completed Update Set is then exported in XML format. The exported XML file contains the project configuration and can be shared or transferred to another ServiceNow environment.

Final Conclusion

- **The Auto Ticket Classification using Flow Designer project successfully delivers a complete, end-to-end automation solution for a school IT helpdesk.The primary objective of reducing manual effort in ticket categorization and improving response efficiency has been fully achieved.**

- **Through structured requirement analysis, careful backend configuration, and no-code automation using Flow Designer, the system now automatically classifies IT tickets based on the short description provided by students. The implementation of dependent choice fields ensures data accuracy, while automated email notifications improve communication by instantly acknowledging ticket creation to the caller.**

- **The solution was developed using a phased approach, ensuring clarity, stability, and ease of maintenance. Comprehensive testing and security validation confirmed that the system functions reliably, maintains data integrity, and enforces appropriate access controls.**

- **Overall, this project demonstrates how ServiceNow can be effectively used to build scalable, maintainable, and user-friendly automation solutions without relying**

on complex scripting or machine learning. The design is well-suited for small to medium environments such as educational institutions and can be easily extended in the future to include advanced features like assignment automation, SLA tracking, or predictive intelligence.
